EDUCATION & COURSEWORK

Duke University

B.S. in Computer Science

Durham, NC

December 2023

- Relevant Coursework: Computer Architecture, Advanced Algorithms, Discrete Math, Data Science, Database Systems

WORK EXPERIENCE

IBM

AI Forward Deployed Engineer (Financial Services Market)

New York City, NY

July 2025 - Present

- Developed an internal alternative to Certinia that enabled development leads to accurately track time invested in client engineering opportunities, eliminating costly third-party licensing and saving IBM hundreds of thousands of dollars annually
- Led the deployment of IBM Quantum Safe Explorer across 5 Mastercard production repos, enabling their developers automated visibility into hundreds of quantum-risk exposures previously requiring manual analysis
- Deployed an internal talent platform for IBM client engineers and managers, using IBM Bob and SAP SuccessFactors to transform career history and goals into searchable talent profiles and curated development plans
- Built a workflow combining IBM Bob and Quantum Safe Explorer that allowed developers to identify and understand quantum-vulnerable cryptography in an application, make remediation changes, and validate those changes through a follow-up scan.

Prometheus Group

Associate Developer

Raleigh, NC

January 2024 - July 2025

- Leveraged TypeScript and React to build the web-based Planning & Scheduling module of the Prometheus Platform, which is an Enterprise Asset Management tool used by over 50,000 people across our client base
- Worked with product managers to turn loosely defined client requests into scoped engineering work, balancing immediate customer needs against product maintainability.
- Develop SQL migration scripts to implement new functionalities in the Planning & Scheduling module and ensure consistency between internal development environments and client environments
- Led the development of a custom date formatting microservice to replace Moment.js, reducing technical debt and optimizing SAP date/time field handling
- Acquired expertise in SAP integration, understanding how different customers use SAP systems and incorporating that into our web application through client meetings

Prometheus Group

Web Development Intern

Raleigh, NC

August 2023 - December 2023

- Implemented RTL (right-to-left) support for the Planning & Scheduling module, allowing languages like Arabic and Hebrew to be displayed, which assisted in Prometheus gaining several new clients in the EMEA region
- Successfully completed diverse Jira tickets in an Agile development cycle, contributing to both the frontend and backend stacks, thereby enhancing product functionality according to client needs
- Collaborated with ABAP developers to implement new API endpoints and backend mappings using Java, allowing seamless integration of client's SAP data within the Prometheus Platform through our Spring Boot backend
- Identified and resolved critical CSS and styling defects during regression testing for our Core 3.31 and 3.32 releases, helping to alleviate customer complaints

SKILLS

Skills: JavaScript, TypeScript, RAG, LLM Evals, Python, Docker, PostgreSQL, Node.js, Pandas, LLM APIs

Certifications: IBM Cloud Essentials, Confluent Data Streaming Engineer

SELECTED PROJECTS

Cognate (TypeScript, Electron): Built a multi-model desktop application with adapters for OpenAI, Anthropic, Gemini, and DeepSeek, secure OS-native credential storage, and PDF attachment support through provider file APIs. **GitHub:** github.com/kevinshah-dev/cognate

LeetBattle (Next.js, TypeScript, PostgreSQL, Cloudflare Workers): Built and deployed a real-time, two-player competitive coding platform where friends join private rooms, receive the same programming challenge, and race to submit the first solution that passes a hidden test suite. Implemented live match synchronization with WebSockets and Cloudflare Durable Objects, secure authentication with Clerk, a Monaco code editor supporting Python and Java, authoritative match state in PostgreSQL, and isolated code execution with Cloudflare Sandbox. **Website:** leetbattle.cenough.games **GitHub:** github.com/kevinshah-dev/leetbattle

CloseEnough Games (Next.js, TypeScript, PostgreSQL, Cloudflare Workers): Built and launched a unified browser-game platform featuring 11 daily and competitive games across history, literature, sports, music, news, trivia, and coding. Developed an arcade-style hub with centralized Clerk authentication and a cross-game player dashboard that aggregates total plays, points, completion rates, best scores and streaks, and recent activity through an authenticated stats API. **Website:** cenough.games **GitHub:** github.com/kevinshah-dev/closeenough

PolicyPeer (Next.js, TypeScript, Tailwind CSS, Supabase): Developed a comprehensive insurance transparency platform allowing users to submit and compare real-life policy data and claims. The web app leverages Next.js 13 App Router for server-side rendering, Supabase for all backend relational data, and user authentication. Additionally, I designed the frontend using Tailwind CSS for a clean and user-friendly data submission experience.

GitHub: github.com/kevinshah-dev/policypeer

Sokoban Solver (Java): Created a Java program that solves levels of the Japanese game Sokoban using popular graph algorithms. The algorithms we implemented include BFS, DFS, Greedy Best-First Search, and A* with a Manhattan Distance Heuristic. **GitHub:** github.com/kevinshah-dev/Sokoban-Solver

Predicting Fantasy Football Output Machine Learning Model (Python, PostgreSQL): Created a machine learning model to help predict NFL players' Fantasy Football point totals. We then used our findings to create compelling visualizations and a website. **GitHub:** github.com/kevinshah-dev/Predicting-Fantasy-Football-Output

PokerGPT (Next.js, TypeScript): Using the OpenAI GPT-4 API, I built a website that analyzes a poker position and recommends how to play optimally using pot size, community cards, bet sizes, position, and the player's cards. **Website:** <https://pokergpt-wine.vercel.app/> **GitHub:** github.com/kevinshah-dev/pokergpt
